FRP rebar is a composite product that replaces steel bar and significantly reduces the damage caused by corrosion of rebar in corrosive and acidic environments. The use of FRP rebar is the best option for reinforcing concrete in places where the concrete has to be in contact with electrical and magnetic fields. FRP rebar can also be used to design and build new buildings. FRP rebar, with its favourable properties, reduces the diameter and increases the distance between bars in reinforced concrete members, such as slabs, tunnels, foundations, etc. Also, FRP rebar will increase the damping induced in the structure against earthquake-induced vibrations or industrial equipment and will be the best option for increasing the strength of the structure against earthquake or vibration and retrofitting structures.
