FRP reactor is a comprehensive reaction vessel, which takes different designs according to the reaction conditions for the structure function and configuration accessories. The reaction polymerization is carried out by mixing a variety of materials through stirring, heating and cooling. From the beginning of feeding, reacting to discharging, the pre-set reaction steps can be completed with a high degree of automation, and the important parameters such as temperature, pressure, mechanical control (stirring, air blowing, etc.) and concentration of reactants/products can be strictly controlled during the reaction process.
