The fuel cell cooling line is an important component for the circulation of cooling medium in the fuel cell system. Its main function is to effectively remove the heat generated by the fuel cell stack during operation, maintain the stack within a stable operating temperature range, and ensure the performance and life of the system. The pipeline is usually made of high temperature and corrosion resistant plastic or metal materials, such as fluororubber tubes, nylon tubes or aluminum alloy tubes, and is connected with cooling pumps, heat exchangers and other components to form a closed liquid cooling circulation system. It is a key component in the fuel cell thermal management system.

United States market for Fuel Cell Cooling Line is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Fuel Cell Cooling Line is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
