A Fuel Cell Hydrogen Ejector is a passive device used in proton exchange membrane (PEM) fuel cell systems to recirculate unused hydrogen from the fuel cell's anode outlet back to its inlet. It operates using the Venturi effect, where high-pressure incoming hydrogen creates a suction force that draws the anode exhaust into the flow stream, eliminating the need for mechanical pumps. This improves hydrogen utilization, enhances system efficiency, and reduces component complexity. With no moving parts, hydrogen ejectors are reliable, compact, and energy-efficient, making them ideal for automotive and stationary fuel cell applications.
