## Abstracts

The global Fuel Cell Powered Forklifts market size is predicted to grow from US\$ 230 million in 2025 to US\$ 372 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

Fuel Cell Powered Forklifts are lift trucks that use hydrogen as the onboard fuel to generate electricity for an electric drivetrain and hydraulic lifting, most commonly through a hydrogen fuel cell power module that functions as a battery replacement or as a hybrid with a small buffer battery. Hydrogen stored in a high-pressure cylinder is fed to the fuel cell, which combines it with oxygen from the air to produce electric power, with water and heat as the main byproducts at the point of use, and the truck is refueled at a hydrogen dispenser in minutes rather than being charged for hours. They are typically deployed in high-utilization environments such as distribution centers, manufacturing sites, and cold storage where multi-shift uptime, consistent power output, and eliminating battery-change rooms can materially improve operations, but their economics and adoption depend on hydrogen supply cost, fueling infrastructure, safety procedures, and service support. The price of this product is approximately US\$30,000 to US\$40,000 per unit.

Upstream, Fuel Cell Powered Forklifts sit at the intersection of the forklift supply chain and the hydrogen fuel cell supply chain: hydrogen is produced through electrolysis or reforming, then purified, compressed, or liquefied, stored, transported, or generated on-site and delivered via on-site infrastructure such as tanks, compressors, refueling stations, and safety systems; simultaneously, fuel cell power modules consist of key components including membrane electrode assemblies with platinum group catalysts, bipolar plates, gaskets and seals, air and hydrogen supply hardware, humidification and thermal management, sensors and controllers, and high-pressure hydrogen cylinders

and valves; while forklift OEMs or integrators combine the fuel cell modules with the forklift's electric drive system, power electronics, and battery or capacitor buffers, and complete verification and certification. Downstream users, such as high-utilization users like distribution centers, cold storage facilities, and manufacturing plants, deploy these forklifts. In these locations, operators can refuel in just a few minutes and operate multiple shifts. Continuous hydrogen supply contracts or on-site production, fleet management and safety training, preventative maintenance of trucks and fuel cell systems, and spare parts and service networks all support these forklifts. When forklifts are scrapped, they are either resold or scrapped, while fuel cell stacks and high-pressure storage tanks are processed according to prescribed inspection, refurbishment, and metal and component recycling procedures.
