The global Fuel Injector Sleeve market size is predicted to grow from US\$ 2301 million in 2025 to US\$ 3434 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

In 2025, global sales of fuel injector sleeves reached 980 million units, with an average selling price of US\$2.4 per unit. Fuel injector sleeves are precision metal components installed in the engine's fuel injection system. They are used to fix and seal the injector body and withstand the high-temperature, high-pressure combustion environment. Their structure is typically made of alloy steel or stainless steel, manufactured through cold forging, precision machining, and heat treatment processes. They possess characteristics such as high strength, corrosion resistance, high-temperature resistance, and dimensional stability. They are crucial basic components ensuring fuel atomization accuracy and engine performance, and are widely used in gasoline and diesel engine power systems. The industry's total production capacity is approximately 1.2 billion units per year, with an average gross profit margin of approximately 21%. Upstream raw materials mainly include alloy steel bars, stainless steel materials, and heat treatment auxiliary materials; downstream, they are supplied to OEMs through injector assembly manufacturers and Tier 1 automotive parts suppliers. Future development lies in the upgrade of high-pressure common rail systems and the expansion of demand for new energy hybrid engines, while also moving towards higher pressure resistance and lightweight design. With the increasing stringency of engine emission standards and the growing trend towards more sophisticated powertrain systems, product technology requirements are constantly rising, and companies with precision machining and materials research and development capabilities will gain stable business opportunities.
