The fuel vapor check valve is a device used to control the flow of fuel vapor. It can prevent fuel vapor from flowing backward from the fuel tank or activated carbon canister into the atmosphere or air intake system, causing pollution or affecting engine performance. The fuel vapor check valve is usually installed at the inlet and outlet of the fuel tank cap, activated carbon canister or solenoid valve. It uses the action of spring or gravity to make the valve only open in one direction and closed in the other direction. The function of the fuel vapor check valve is to ensure the normal operation of the fuel vapor recovery system, improve fuel utilization, reduce exhaust emissions, and protect the environment.
