The global annual production capacity for full-array LED-backlit televisions stands at approximately 3 million units, with a gross margin of approximately 22.8%. A full-array LED-backlit television typically refers to a TV set where the backlight source consists of multiple LEDs distributed across the entire screen (rather than being concentrated solely along the edges or in a few localized zones). In other words, the LED beads are arranged in an array covering the entire back of the screen; when combined with local dimming control, this configuration enables more precise brightness adjustment?allowing specific areas to be brighter while others remain darker?thereby enhancing contrast, shadow detail, and overall picture uniformity. The upstream segment of the full-array LED-backlit television industry chain comprises components such as LED backlight strips, LED beads, display panels, and packaging materials; the midstream segment consists of the full-array LED-backlit television manufacturers themselves; and the downstream segment primarily encompasses commercial and private end-use applications.
