The global Full-automatic Wafer Laser Marking Machine market size is predicted to grow from US$ 187 million in 2024 to US$ 267 million in 2030; it is expected to grow at a CAGR of 6.1% from 2024 to 2030.

Laser marking machine is a device that uses high-energy laser beam to carve any desired text, graphics and images on the surface of an object. The effect of laser marking machine is to use high-energy density laser to partially irradiate the workpiece, so that the surface materials of various materials evaporate and expose the deep materials, thereby marking a permanent mark. This mark can be a beautiful pattern, trademark and text.

The wafer laser marking machine is generally understood as a marking machine acting on the wafer. Laser action on the wafer through the thermal light source instantaneous thermal ablation and vaporisation or through the cold light source to interrupt the material molecular bond, leaving the corresponding characters, text or patterns and other information on the wafer surface, wafer marking with automatic loading and unloading, automatic positioning, automatic marking function.Fully automatic wafer laser marking does not require human intervention and is equipped with automatic loading and unloading, which can greatly improve production efficiency and reduce manual intervention and production costs.

The market limitations and challenges faced by fully automatic wafer laser marking machines are mainly as follows:

1. The semiconductor industry, including the semiconductor equipment industry, is dependent on global supply chains. Political, geopolitical, economic and financial crises and instability have negatively impacted the semiconductor industry and its end markets in the past and may do so again in the future. Prolonged or increased use of trade barriers could result in slower global economic and semiconductor industry growth and could cause global market volatility, which could lead to lower end-customer electronic product sales and could reduce demand for semiconductor equipment products and services. Such developments could negatively impact the ability of semiconductor equipment suppliers to sell, ship products, collect payments and provide support to customers in certain regions in accordance with trade restrictions, embargoes, logistics restrictions and export control laws. Semiconductor equipment suppliers could also face shortages, increased costs and shipping delays for certain semiconductor components due to supply chain disruptions caused by geopolitical conflicts, such as recent hostilities affecting shipping in the Red Sea, which have resulted in increased shipping costs and delivery time delays, as well as related insurance costs, and the ongoing conflict between Russia and Ukraine.

2. Fierce market competition: In recent years, due to the sanctions imposed by the United States, great opportunities have been given to Chinese semiconductor equipment manufacturers. Chinese semiconductor equipment manufacturers need to continuously improve their own technical level and product quality, and accelerate the process of domestic substitution to meet the challenges from domestic and foreign competitors. In the future, Chinese semiconductor equipment manufacturers will face a more complex international environment. However, with the support of the government and the promotion of the market, these companies will continue to maintain a rapid development momentum. By increasing R&D investment, expanding market share, and strengthening industrial chain integration, they will continue to improve their competitiveness and influence. The competition among international companies in the Chinese market will become increasingly fierce.
