The global Full Bridge Gate Driver market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A full-bridge gate driver is an electronic device used to control the switching state of power semiconductor devices (such as MOSFETs, IGBTs) in a full-bridge topology to achieve power conversion. A full-bridge gate driver usually consists of four single-bridge gate drivers that can provide high-speed, high-precision, and high-stability signals to control the working state of the full-bridge topology. The basic principle of the full-bridge gate driver is to use control signals to drive the gate signals of four power semiconductor devices to realize the working state control of the full-bridge topology. By adjusting the frequency, duty cycle and phase of the control signal, the output voltage and current of the full-bridge topology can be controlled to realize the function of power conversion.
