The global Full Dry Optical Cable market size is predicted to grow from US\$ 7861 million in 2025 to US\$ 12217 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

In 2025, the global production of Full Dry Optical Cable reached approximately 1 million tons, with an average global market price of around US\$2,000 ? US\$10,000 per ton. In the same year, the global total production capacity of Full Dry Optical Cable reached 1.25 million tons. The industry average gross profit margin of this product reached 23%. Full Dry Optical Cable refers to a type of optical cable that employs dry water-blocking technology without grease or filler adhesives in its structure. It achieves waterproof and moisture-proof functions by using materials such as expanding yarn, dry water-blocking powder, or water-absorbing resin. Its internal structure does not contain traditional grease or gel fillers, thus significantly improving construction efficiency, reducing maintenance difficulty, and minimizing environmental pollution while ensuring stable optical fiber transmission performance. It is widely used in communication network backbones, access networks, and data center fiber optic cabling systems.

The Full Dry Optical Cable industry chain can be divided into three main segments: upstream material supply, midstream optical cable manufacturing, and downstream communication applications. The upstream mainly includes suppliers of optical fiber preforms, optical fibers, aramid fibers, water-blocking expanding materials, and polymer sheath materials. The midstream involves optical cable manufacturers responsible for secondary coating of optical fibers, cable design, dry water-blocking structure encapsulation, and outer sheath extrusion molding. The downstream is used by telecommunications operators, data centers, broadcast networks, and industrial communication systems to build optical fiber backbone networks, metropolitan area

networks, and access networks, forming a stable demand structure driven by communication infrastructure investment.

With the deepening of global 5G network construction, the explosive growth of data center traffic, and the advancement of F5G technology, Full Dry Optical Cable is gradually replacing traditional grease-filled optical cables as the mainstream development direction due to its advantages such as convenient construction, strong environmental protection, and low long-term maintenance costs. At the same time, demand continues to grow in scenarios of massive fiber optic deployment and high-density cabling. In the future, industry growth will be mainly driven by the construction of communication infrastructure in emerging markets and the expansion of cloud computing. However, it will also face profit pressure from declining fiber optic prices and intensified industry competition, presenting an overall development trend of 'stable demand growth + price pressure + structural upgrading'.
