The global Full-metal Inductive Sensor market size is predicted to grow from US\$ 464 million in 2025 to US\$ 757 million in 2031; it is expected to grow at a CAGR of 8.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A Full-metal inductive sensor is a type of proximity sensor designed entirely with a metal housing and sensing face, typically made of stainless steel, to offer exceptional durability and resistance to harsh industrial environments. Unlike standard inductive sensors that may have plastic or polymer sensing surfaces, full-metal sensors are built to withstand high levels of mechanical stress, abrasion, vibration, and frequent washdowns. They operate by generating an electromagnetic field that detects metallic objects without physical contact, making them ideal for position detection and object recognition in applications such as metal processing, automotive manufacturing, food and beverage production, and heavy machinery. Their rugged construction also makes them suitable for use in environments exposed to oil, coolant, metal chips, and aggressive cleaning agents, ensuring long service life and high reliability under demanding conditions.

United States market for Full-metal Inductive Sensor is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Full-metal Inductive Sensor is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
