The full suspension has a variety of design purposes, including improving comfort and increasing traction in complex terrain. Regardless of its purpose, the full suspension always works on the same principle. The shock absorber absorbs the energy generated by the impact of the front and rear wheels through the spring (including air spring and oil pressure spring) to reduce the impact received by the driver. In the past few decades, designers and engineers have created many kinds of suspension with different riding characteristics. Different suspension designs have different characteristics of stepping, braking and shock absorption.
