## Abstracts

The global Fullerene Derivatives PCBM market size is predicted to grow from US\$ 66.22 million in 2025 to US\$ 116 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

PCBM is a fullerene derivative of the C60 buckyball (or C70) that was first synthesized in the 1990s. It is an electron acceptor material and is often used in organic solar cells (plastic solar cells) or flexible electronics in conjunction with electron donor materials such as P3HT or other conductive polymers.

PCBM, including C60-PCBM and C70-PCBM derivatives, remains one of the most widely used electron acceptor materials in organic photovoltaics (OPVs) and organic electronics. C60-PCBM offers excellent electron mobility, processing compatibility, and thermal stability, while C70-PCBM provides enhanced light absorption in the visible range, improving device efficiency.

Although non-fullerene acceptors (NFAs) have gained prominence in recent years, PCBM retains significant value due to its mature fabrication processes, stable molecular structure, and broad compatibility with donor materials. In particular, C70-PCBM is finding increasing use in high-efficiency OPVs and photodetectors, driven by its superior optical properties.

The global PCBM market continues to expand steadily. Synergistic development in raw materials, device processing, and downstream applications further supports market resilience.

Looking forward, the rising demand for sustainable energy solutions and lightweight

electronics ensures that PCBM's will remain a key material in the evolving organic electronics industry, balancing performance, stability, and cost.
