A fully automated blood culture instrument is a laboratory device designed to detect the presence of microorganisms such as bacteria or fungi in blood samples. This instrument combines automated processes including cultivation, detection, and identification to

provide fast and accurate results. The working principle of this instrument is to collect a small amount of blood sample and place it in a sterile culture bottle. Then place the bottle into the instrument, which will automatically cultivate the sample at an appropriate temperature and monitor the growth of microorganisms. If there are microorganisms in the sample, they will reproduce and produce gas, which will be detected by the instrument's sensors. Once the presence of microorganisms is detected, the instrument can perform additional tests to identify specific types of organisms present. This information is crucial for the diagnosis and treatment of infections, as different types of microorganisms require different treatments.
