Fully Automatic Disposable Biopsy System is a biopsy instrument. Disposable full automatic biopsy devices used for core samples from soft tissue and organs. This a guilotine type automatic biopsy needle with a stylet with sample notch and a cm marked echogenic cutting cannula.

A fully automated disposable biopsy system is a medical device that is used to perform tissue biopsies to assist doctors in diagnosis and treatment planning of patients. A biopsy is a common procedure in which a tissue sample is taken for pathological examination to determine whether there are abnormalities or cancer cells in the tissue. The special feature of this fully automatic disposable biopsy system is that it is single-use, so a new system can be used between each patient, avoiding the risk of cross-infection. Many steps in the biopsy process of the system are automated, which can improve the accuracy and efficiency of the operation and reduce errors caused by human operation. A fully automated disposable biopsy system usually includes a sampler, a needle, a sampling container, and an automated instrument to process and preserve the obtained tissue sample. When a physician uses a fully automated single-use biopsy system, a physician positions a needle or sampler on the tissue site to be biopsied, triggers the system to obtain a tissue sample, and sends the sample to a laboratory for pathology examination. Pathologists will carefully observe and analyze the samples to determine whether there are abnormal cells or pathological changes,
