Automatic Insertion Machine, that is, some of the regular electronic components automatically (also known as 'automatic plug-in machine') standard inserted in the printed circuit board conductive through-hole in the mechanical equipment.

The automatic insertion machine is a machine that automatically installs the braided electronic components on the printed circuit board according to the program. The traditional electronic assembly industry mainly relies on workers to insert electronic components into the circuit board. Since the machine began mass production, the manual plug-ins have been slow and the defects of poor workmanship have been exposed. Using the insertion machine to automatically install the electronic components on the circuit board can save labour costs and improve the plug-in process level.

The operation of the automatic insertion machine basically includes such components as capacitors, inductors, connectors, etc. the engineering personnel of the design process will divide the work of the plug-in parts of each station according to the workload and rationality. Each machine is only responsible for installing several components, and repeat the same operation to minimize the chance of error.

Global key players of fully automatic insertion include Universal Instruments, Panasonic, Juki, etc. Asia-Pacific is the largest producer of fully automatic insertion, holds a share about 70%, followed by North America, and Europe. In terms of product, radial is the largest segment, with a share about 30%. And in terms of application, the largest segment is home appliances, with a share about 40%.
