The global Fully Automatic Motor Winding Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The fully automatic motor winding machine uses precise mechanical movement and electrical control to wind the materials required in the motor manufacturing process (such as winding wire, insulating paper, etc.) to the specified position according to the predetermined trajectory and parameters to form the key components of the motor.

The working principle of the fully automatic motor winding machine is to accurately control the movement and position of the winding device through the control system, and at the same time, the tension control system adjusts the tension of the material in the winding process in real time. During the winding process, the material is fed into the winding device and wound according to the predetermined trajectory and parameters to form the key components of the motor.
