The fully automatic quantitative parallel concentrator is an efficient sample pretreatment device based on the synergistic effect of water bath heating and nitrogen purge. It reduces the solvent vapor pressure by disturbing the sample surface with vortex airflow, and realizes the rapid evaporation and concentration of multi-channel liquids. Its core technology is to integrate optical sensors to monitor the sample volume in real time, support automatic volume setting at 0.5mL or 1mL endpoint, and use PID precise temperature control and nitrogen blow needle adaptive descent technology with liquid level to ensure parallelism and reproducibility.
