The global Fully Automatic Permanganate Index Analyzer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The fully automatic permanganate index analyzer is an instrument and equipment used for water quality analysis, mainly used to measure the permanganate index (also known as potassium permanganate index, chemical symbol COD-Mn or COD_KMnO₄) in water. The permanganate index is an important indicator for evaluating the oxidation of organic matter in water, especially for assessing the degree of pollution in water bodies. This analytical instrument can automatically complete sample processing, reagent addition, reaction progress, data recording, and result calculation. By measuring the consumption of permanganate in the sample under certain conditions, the total amount of organic matter or the concentration of oxidizable organic matter in the water sample can be indirectly reflected, thereby determining the degree of water pollution.
