## Abstracts

The global Fully Automatic Potentiometric Titrator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Automatic potentiometric titration is an instrument used for chemical analysis, which can automatically perform potentiometric titration experiments. Potentiometric titration is a common analytical technique used to determine the concentration of chemical substances in solution. The automatic potentiometric titration instrument has the characteristics of automation, which can improve the accuracy, efficiency and repeatability of the experiment. According to different functions and application requirements, the full-automatic potentiometric titration instrument can have the following features: automatic titration: the full-automatic potentiometric titration instrument can automatically perform the titration process, including the control of the dosing rate of titrant, the detection and interpretation of the titration endpoint. It can accurately calculate the volume of titrant based on preset parameters and titration curves, thereby determining the concentration of analytes in the solution to be tested. Titration end point detection: the full-automatic potentiometric titration instrument usually uses the potentiometric titration method for analysis, that is, to determine the titration end point by detecting the change of solution potential. It can be equipped with high-precision potential sensors to monitor the potential changes of the solution in real-time during the titration process, and automatically stop titration based on the preset titration endpoint criteria. Data processing and recording: The full-automatic potentiometric titration instrument usually has the function of data processing and recording. It can perform real-time analysis and processing of potential, volume and other data during the titration process, and generate reports such as titration curves and concentration calculation results. Some instruments can also transmit data to a computer for further

analysis and storage through computer software or data interfaces. Multi channel and multi parameter: some full-automatic potentiometric titration instruments have the ability of multi-channel titration, and can conduct titration analysis of multiple samples at the same time. In addition, it can also support the measurement and analysis of multiple parameters, such as acid-base titration, redox titration, complexation titration, etc.
