The global Fully Automatic Secondary Thermal Desorption Instrument market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

FASDTI is a specialized equipment used for analyzing volatile organic compounds (VOCs) in solid and liquid samples. This instrument uses a process called thermal desorption to extract volatile organic compounds from the sample, and then analyzes them using gas chromatography-mass spectrometry (GC-MS). FASDTI is fully automated, which means it can process multiple samples in one run without manual intervention. This makes it an efficient and reliable tool for analyzing a large number of samples in a short period of time. The thermal desorption process is carried out by heating the sample to a high temperature, which can cause volatile organic compounds to evaporate and be trapped on specialized adsorption materials. Then heat the adsorption material again to release volatile organic compounds, which are carried by the carrier gas to GC-MS for analysis. FASDTI is commonly used for environmental monitoring, industrial hygiene, and forensic investigations, where the detection and quantification of volatile organic compounds are important. It is also used for research applications such as air pollution research and analysis of volatile compounds in food and beverages. Overall, FASDTI is a powerful analytical tool that can quickly and accurately analyze volatile organic compounds in various sample types.
