The global Fully Automatic standalone HE Staining Machine market size is predicted to grow from US\$ 209 million in 2025 to US\$ 311 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Fully Automatic standalone HE Staining Machine is an advanced pathological tissue section staining device. It revolutionizes the traditional immersion staining method by independently and precisely dispensing hematoxylin and eosin dyes onto each slide, thereby eliminating cross-contamination, improving staining quality and efficiency, and reducing the use of toxic reagents. This results in more accurate, safer, and faster pathological diagnoses.

The upstream supply chain mainly includes high-precision mechanical components and chemical reagents. The drop-staining technology, in particular, requires extremely high stability from the precision liquid handling system and pressure sensors.

Annual sales volume is in the thousands of units. Product prices mainly depend on the equipment's performance, brand, degree of automation, and specific configuration, ranging from US\$28,000 to US\$100,000 per unit. The industry's gross profit margin is in the range of 25%-40%.

Traditional immersion staining methods have long been plagued by issues such as reagent cross-contamination, color shifting, and reagent oxidation due to environmental exposure. Fully automated, individual droplet staining equipment, however, achieves high consistency and standardization in staining. This technology represents not only a hardware upgrade but also a significant leap forward in pathology quality control, and is an indispensable foundation for building intelligent pathology laboratories. With the

rising incidence of cancer and the increasing adoption of precision medicine, clinicians are demanding higher accuracy and faster turnaround times for pathology reports. Automated droplet staining equipment can significantly reduce human error and shorten slide preparation time.
