Fully Distributed Symmetric Storage System is an advanced storage solution designed to provide high availability, performance and scalability. It is characterized by the symmetric distribution of data and storage nodes in the system, with each node having equal responsibilities and resources. A fully distributed symmetric storage system is a design with no single point of failure in the data storage architecture. Each storage node in the system has equal duties and resources and data is symmetrically distributed across all nodes. The system improves system reliability and performance through symmetric distribution and redundancy techniques. Each node can simultaneously act as data storage, processing and transmission to ensure high availability and scalability of the system.
