Fully immersed liquid-cooled servers are a data center equipment cooling technology whose core idea is to completely immerse servers and other computing equipment in a specific liquid medium to effectively dissipate heat. This technology utilizes the high thermal conductivity properties of the liquid to quickly transfer the heat generated inside the server into the liquid and remove the heat through the external cooling system, thereby achieving efficient cooling of the server. Compared with traditional air cooling, full immersion liquid cooling technology can provide higher heat dissipation efficiency and energy utilization, while reducing data center energy consumption and carbon emissions.

The global Fully Immersed Liquid-Cooled Server market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
