The global Fully Insulated Tubular Busbar market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The main insulation structure of the fully insulated tubular busbar is made by a three-layer co-extrusion process. The rated current of the product is 630A~8000A, and the rated voltage is 3.6kV~40.5kV. It can be used in AC or DC systems. The conductor can be a copper tube or an aluminum tube. From the inside to the outside, the product is a tubular conductor, an inner shielding layer, a main insulation layer, an outer shielding layer, a metal shielding layer, an inner lining protective layer and an outer sheath. The main insulation layer electrically isolates the conductor from the earth and the conductors of different phases from each other; the inner and outer shielding layers are made of semi-conductive materials to improve the electric field distribution; the metal shielding layer passes the capacitive current during normal operation and also plays the role of shielding the electric field. The product has excellent electrical insulation performance. The capacitive screen structure and continuous metal shielding can effectively prevent the generation of induced voltage, and the partial discharge can be stably controlled below 10pC.
