Fumed nanosilica for rubber tires is a type of nanoscale material that is used as a reinforcing filler in the production of rubber tires. It is derived from silicon dioxide and has a high surface area, which allows it to interact effectively with the rubber matrix. Fumed nanosilica is added to the rubber compound during the tire manufacturing process to enhance the mechanical properties of the tire. It improves the tensile strength, tear resistance, and abrasion resistance of the rubber, leading to better overall tire performance. The use of fumed nanosilica in rubber tires can result in tires that have improved grip on wet and dry surfaces, reduced rolling resistance for improved fuel efficiency, and increased durability. It also helps to reduce heat buildup during tire

operation, which can contribute to longer tire lifespan.
