Fumed silica (white carbon black) is a fine, special amorphous silica product made through a specific process.

Fumed silica for cosmetics is an extremely fine nano-scale amorphous silica, the main feature of which is its small and uniform particle size, which enables it to be effectively dispersed in the matrix of cosmetics, improving the stability and uniformity of the product.

Fumed silica mainly plays an anti-sedimentation and dispersing role in nail polish, effectively improving the color and coating of nail polish; it is used as a thickener and thixotropic agent in sunscreen, effectively improving the spreadability of sunscreen.

Fumed silica is divided into hydrophilic and hydrophobic. Different types have different applications and different effects. For example, hydrophobic fumed silica can improve the waterproofness of sunscreen, reduce the erosion of sunscreen by sweat, and extend the sunscreen time.

The global Fumed Silica for Cosmetic market size is projected to grow from US\$ 183 million in 2024 to US\$ 275 million in 2030; it is expected to grow at a CAGR of 7.1% from 2024 to 2030.
