Fundus disease auxiliary diagnosis software is a medical software based on artificial intelligence technology, designed to help doctors diagnose fundus diseases. Fundus disease auxiliary diagnosis software is a software system that automatically analyzes, identifies and diagnoses fundus images by integrating advanced technologies such as image processing, machine learning, and deep learning. It can assist doctors in quickly and accurately identifying fundus lesions, improve the efficiency and accuracy of diagnosis, and provide strong support for the early detection and treatment of fundus diseases.

The field of retinal disease auxiliary diagnostic software has broad prospects and clear market drivers. With the global increase in diabetes and the aging population, the demand for early screening of retinal diseases is becoming increasingly rigid; advancements in deep learning technology continue to improve the accuracy and generalization ability of algorithms; and regulatory agencies in various countries are gradually accelerating the approval of related products, promoting their clinical compliance. Future development trends will focus on: multi-dimensional technological integration, application scenario expansion, and functional extension. This field is expected to become a key digital tool for eye health management and even chronic disease prevention and control systems.
