Furnace brazing is a welding method that uses radiation heating with an inflated or vacuum-protected resistance furnace. In this method, the brazing furnace heats the workpiece through a heating system to reach the temperature required for brazing. At the same time, the protective atmosphere system of the brazing furnace uses inert gas or reducing gas as the protective atmosphere to exclude the air around the workpiece to prevent the metal material from being affected by oxidation during the brazing process, thereby ensuring the quality and reliability of the brazed joint.

Furnace brazing has the characteristics of high production efficiency, mass production, and high brazing production quality, and is often used for welding key parts. In addition, furnace brazing is also widely used in electronics, aerospace, construction, automobile manufacturing, medical equipment and other fields, providing high-quality welding and heat treatment services for these industries.

The global Furnace Soldering Services market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
