## Abstracts

The global Fused Corundum Bricks market size is predicted to grow from US\$ 685 million in 2025 to US\$ 969 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Fused corundum bricks are high-performance refractory products made primarily from industrial alumina or high-quality bauxite. The molten material is completely melted in an electric arc furnace at high temperatures (typically >2000?), then poured into molds of a specific shape, followed by cooling, crystallization, annealing, and machining. The core demand stems from the extreme requirements of modern high-temperature industries (such as glass, petrochemicals, steel, and ceramics) for ultra-long lifespan and stable production of key components in kilns under extreme temperatures, chemical corrosion, and mechanical erosion. The upstream supply chain begins with raw materials such as high-purity industrial alumina and zircon sand, as well as specialized equipment such as large electric arc furnaces required for production. Downstream, it is directly used in the construction and maintenance of major industrial kilns such as glass melting furnaces, petrochemical gasification furnaces, steel refining units, and ceramics. Its performance directly determines the continuity and economy of high-end manufacturing processes. In 2025, the production of fused corundum bricks is estimated at approximately 200,000 tons, with an average selling price of approximately US\$3,500 per ton, a gross profit margin of approximately 30%, and a single-line capacity of approximately 6,000 tons per year.

United States market for Fused Corundum Bricks is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
