The global Fused Granulate Fabrication (FGF) 3D Printer market size is predicted to grow from US\$ 54.96 million in 2025 to US\$ 192 million in 2032; it is expected to grow at a CAGR of 19.9% from 2026 to 2032.

Fused Granulate Fabrication (FGF) is an underestimated 3D printing technology, which has advantages such as low material cost and fast printing speed compared to traditional FDM/FFF technology. At the same time, it is possible to use high-strength, outdoor weather resistant and other granular materials for printing, making this technology highly popular in the application markets of indoor and outdoor sculptures, irregular walls, furniture, molds, display props, etc.

Fused Granulate Fabrication (FGF) 3D Printer is an advanced type of 3D printer that uses thermoplastic pellets instead of traditional filament or resin as the printing material. These printers are equipped with a screw or extruder that melts and deposits the plastic pellets layer by layer to create the desired object. Pellet 3D printing is often more cost-effective and versatile, allowing the use of a wide range of materials, including recycled plastics.

Fused Granulate Fabrication (FGF) 3D Printer typically use lower-cost raw materials compared to traditional filament printers, making them more economical for large-scale production, which is attractive to industries such as automotive, consumer goods, and aerospace. In 2023, automotive accounted for 29.37% of the sales market share, and is expected to account for 31.25% of the market share in 2030, while consumer goods and aerospace accounted for 22.22% and 15.69% respectively.. In terms of type, industrial grade accounts for the vast majority of the market share, accounting for 90.25% of the market share in 2023, and is expected to account for 93.55% of the market share in

2030.
