The global Fused Quartz Fiber market size is predicted to grow from US\$ 73.17 million in 2025 to US\$ 106 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Fused Quartz Fiber, sometimes called quartz glass fiber, is a type of high-purity amorphous silica fiber made by drawing filaments from molten fused quartz (SiO_2) rather than regular silica sand or chemical precursors like in standard glass fibers.

The quartz glass industry is a material and product industry with silicon dioxide as the main raw material component. The main component of quartz is silicon dioxide, which is widely distributed.

The main component of quartz glass is silicon dioxide, which is generally stored in the form of rods or ingots.

Quartz stone is a non-metallic mineral, and its mineral component is mainly silicon dioxide (SiO_2).

In the upstream quartz sand industry, the production of high-purity quartz sand is closely related to high-quality mineral sources, and it is more difficult to purify low-quality mineral sources. Unimin uses granite pegmatite from SprucePine in the United States as raw material to purify high-purity quartz sand, monopolizing 80% of the high-purity quartz sand market and being a supplier to many high-end quartz glass material companies. Other market participants include Norway's TQC, which mines quartz mines in SprucePine and Norway. In recent years, the quality has improved and the market share has increased.

Due to high technical barriers, only a few companies in the world can mass produce,

and the price of high-purity quartz fiber (SiO_2 99.9%) remains high, but the growing demand drives the industry to high gross profit margins.
