A spherical lens is an optical lens with one or two surface shaped like a cut of sphere that causes light rays to converge or diverge, meaning this surface can be defined from a center reference point and a fix radius of curvature. Spherical lens are the more commons form of optical lens, being easier to design, easier to manufacture and easier to check the quality, in part because they project images onto the sensor without affecting their aspect ratios. Fused Silica Spherical Lenses are useful for a wide range of applications. Cylindrical lenses are optical lenses which focuses light into a line instead of a point. A cylindrical optical lens is typically used to focus, condense or expand incoming light. The curved face or faces of a cylindrical lens are sections of a cylinder and focus the image passing through it into a line parallel to intersection of the surface of the lens and a plane tangent to it along the cylinder's axis. The lens converges or diverges the image in the direction perpendicular to this line and leaves it unaltered in the direction parallel to its cylinder's axis (in the tangent plane). These cylindrical lenses are designed for applications requiring one-dimensional shaping of a light source. This report mainly focuses on fused quartz mirros market.

The global Fused Quartz Mirros market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
