Fused silica, a high-purity form of glass, is particularly well-suited for endoscopy due to its exceptional transparency in the ultraviolet (UV), visible, and near-infrared (NIR) regions of the electromagnetic spectrum. This transparency allows for efficient transmission of light, providing clear and detailed visualization within the body. In endoscopy, fused silica glass rod lenses are commonly used as relay lenses. They are positioned within the endoscope to transmit light and images from the targeted area to the imaging system. These lenses help maintain the clarity, focus, and resolution of the internal images obtained during endoscopic procedures.
