Fusion visual computing chips are high-performance chips that integrate multiple visual perception and computing processing functions. They are widely used in intelligent driving, robots, AR/VR equipment, smart security, industrial automation and other fields. The chip integrates multi-source data such as multiple cameras, radars, depth sensors, etc. to achieve real-time perception, recognition, ranging and dynamic tracking of the environment, and can simultaneously complete complex tasks such as image processing, object recognition, and deep learning reasoning. Fusion visual computing chips usually integrate AI accelerators, image signal processors (ISPs), neural network processing units (NPUs) and multi-core CPUs/GPUs. They have the characteristics of low latency, high throughput and low power consumption, and can meet the strict requirements of the edge side for real-time performance and energy efficiency.
