An accelerometer is a sensor that detects the linear motion of any device in one specific direction and measures the overall acceleration of the device, which includes the static acceleration due to gravity when the object is not moving. A gyroscope, on the other hand, is a sensor that recognizes the angular movement of a device around each axis. Accelerometers and gyroscopes are used in applications such as navigation, automotive and consumer electronics. These sensors are widely used in airbags to activate them in the event of a crash, in game consoles for better motion control, in many cell phones to recognize tap gestures, and to automatically change screens when electronic devices are rotated direction. The growth of the global accelerometer and gyroscope industry is expected to be driven by factors such as continued increase in global defense spending and increasing demand from the consumer electronics industry. Furthermore, developments in the autonomous vehicle industry are driving the growth of the accelerometers and gyroscopes market
