The global Gait Analysis Motion Capture System market size is predicted to grow from US\$ 583 million in 2025 to US\$ 1016 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

In 2024, global sales of gait analysis motion capture systems reached 6,409 units, with an average selling price of US\$86,324 per unit.

Gait analysis motion capture system is a specialized setup used to study and evaluate human or animal gait patterns and movements. This system typically involves the use of motion capture technology, such as cameras or sensors, to track the movement of markers placed on the body during walking or running. The captured data is then analyzed to assess parameters like step length, cadence, joint angles, and foot pressure distribution, providing valuable insights for biomechanics research, sports performance assessment, and rehabilitation.

The core components of a gait analysis motion capture system are a high-speed infrared camera (180-300 Hz, 4-megapixel), a passive reflective marker ball, a 3D force stage, 64-channel wireless EMG electrodes, and a GPU image workstation. The camera and lens account for 65%-70% of the BOM cost, and the raw materials account for approximately 60% of the total cost. The cost structure is characterized by high materials, high R&D, low labor: direct materials account for about 60%, software algorithms and clinical validation amortization account for 20%, and labor and manufacturing costs are only 10%-15%. Scaling up and replacing cameras with domestically produced ones can reduce the material cost to 55%, which is currently the main path to cost reduction.
