The global Gallium Indium Tin Alloy Thermometer market size is predicted to grow from US\$ 110 million in 2025 to US\$ 165 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

In 2025, global Gallium Indium Tin Alloy Thermometer production reached approximately 22.46 million units , with an average global market price of around US\$ 5 per unit.

A gallium–indium–tin alloy thermometer is a mercury-free liquid-column clinical thermometer in which a low-melting Ga–In–Sn alloy (often similar in composition to Galinstan) replaces the traditional mercury column and expands within a capillary glass tube or sealed chamber to indicate temperature. The alloy remains liquid at room temperature, has a low melting point and stable thermal expansion, and contains no highly toxic elements such as mercury; combined with high-transparency capillary glass and printed scales, it offers a reading style and accuracy (typically 0.1°C resolution) comparable to classic mercury thermometers while providing significantly improved safety. Gallium–indium–tin thermometers can be made as conventional straight glass oral/axillary thermometers, or integrated with plastic housings, shake-down or tip mechanisms and even electronic sensing modules, serving as “mercury-free glass thermometers” or hybrid products that preserve the familiar liquid-column user experience as mercury-containing medical devices are phased out in favor of safer alternatives for hospitals, clinics and home users.

In the value chain, gallium–indium–tin thermometers rely upstream on producers of low-melting metals and alloys (gallium, indium and tin), high-borosilicate glass tubing and capillaries, as well as suppliers of plastic housings, sealing plugs, printing inks for

scales, disinfectants and packaging materials. Gallium and indium are typically sourced as high-purity by-products from aluminium and zinc smelting, while tin comes from refined tin smelters; representative players include various gallium/indium refiners in China and Southeast Asia and major tin producers such as those in Yunnan and Malaysia, while borosilicate glass tubes are provided by specialised glass-tube and medical glassware manufacturers. In the midstream, thermometer and temperature-measurement device manufacturers formulate and fill the Ga–In–Sn alloy, perform sealing and calibration, shape the glass envelopes and carry out final assembly—ranging from European mercury-free glass thermometer brands and broader vital-signs equipment makers to numerous OEM/ODM medical-device factories in China, India and other regions. Downstream, gallium–indium–tin thermometers are distributed through pharmaceutical wholesalers, retail pharmacies, e-commerce and medical-procurement channels into hospitals, primary-care clinics, schools and public health institutions, as well as widely into home-use and maternal/child segments, where they complement or compete with digital electronic thermometers and infrared forehead thermometers; some variants are also used in veterinary practice and laboratory settings. Overall, the product sits at the intersection of non-ferrous metals, glass/plastic components and medical end-use markets, with demand strongly influenced by public-health events, regulatory restrictions on mercury, consumer health awareness and the penetration of digital thermometry.

The annual production capacity of a single-line Gallium Indium Tin Alloy Thermometer is approximately 500k units, with a gross profit margin of approximately 30%-40%.
