The global GalNAc-siRNA Conjugates Drug market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

GalNAc-siRNA conjugates are polysaccharide-siRNA monoconjugates formed by covalently fixing N-acetylated galactosamine (GalNAc) in a trivalent state to the 3' end of the right strand of siRNA of different sequences. GalNAc is a targeting ligand of sialic acid receptor (ASGPR) with high affinity and rapid internalization to liver surface cells, enabling such siRNA conjugates to specifically bind to membrane proteins and enter the cytosol. GalNAc conjugation modification is currently the most commonly used small nucleic acid drug delivery system and has excellent potential in the treatment of liver-related diseases involving gene overexpression. GalNAc conjugates have largely replaced lipid nanoparticles (LNP) for siRNA delivery for liver-targeted diseases. Therefore, drugs based on GalNAc-siRNA conjugates have bright application prospects in cardiovascular diseases, metabolic diseases, and neurological diseases.
