The galvanic skin response module?GSR module) is an integrated, plug-and-play physiological signal measurement unit that non-invasively monitors changes in the excitability of the human autonomic nervous system by detecting minute changes in the conductivity of the skin surface. Demand primarily stems from the rapid growth in the quantitative analysis of objective and continuous physiological indicators in fields such as affective computing, mental health monitoring, human-computer interaction, and market research. Its upstream supply chain core includes the research and manufacturing of biocompatible electrode materials, high-precision analog front-end chips, microcontrollers, and wireless communication chips, and is highly dependent on the software ecosystem of biosignal algorithms. Downstream, it directly connects with wearable device manufacturers, research institutions, consumer electronics manufacturers, and interactive content developers, ultimately serving personal health management, user experience optimization, and cutting-edge scientific research through integration into smartwatches, VR devices, biofeedback devices, and other terminal products. In 2025, the production volume of GSR module is estimated at approximately 8 million units, with an average selling price of approximately US\$15 per unit, a gross profit margin of approximately 35%, and a single-line production capacity of approximately 50,000 units per year.
