The global Galvo Mirror market size is predicted to grow from US$ 182 million in 2025 to US$ 307 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

A Galvo Mirror is a lightweight, high-flatness and high-reflectivity optical mirror mounted on the rotating shaft of a galvanometer scanner. It is used to rapidly deflect, position or scan a laser beam by rotating at a controlled angle under servo or resonant drive. The product itself is not a complete galvanometer scanner or scan head, but a critical reflective optical component that directly affects scanning speed, beam pointing accuracy, dynamic flatness, laser power handling, thermal stability and long-term reliability of the laser processing or imaging system.

The upstream materials mainly include fused silica, optical glass, silicon, silicon carbide, beryllium, aluminum alloy and other lightweight mirror substrates, as well as high-reflective metallic coatings such as aluminum, silver and gold, dielectric multilayer coatings, adhesion layers, protective overcoats and precision bonding or mounting materials. Material selection depends on laser wavelength, beam diameter, laser power, scanning speed, mirror inertia, thermal deformation and environmental durability. Downstream customers are mainly galvanometer scanner manufacturers, laser scan head manufacturers, laser processing equipment companies, optical system integrators and medical or scientific imaging equipment suppliers.

In 2025, global sales of Galvo Mirror reached approximately 2,856 K Pieces, with an average global market price of around US$ 65/Piece. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 60%.
