Gamma globulin therapeutic agents are medications derived from human plasma that contain a high concentration of antibodies, also known as immunoglobulins. These agents are primarily used to boost the immune system in individuals who have weakened or compromised immunity. They can be administered intravenously (IVIG) or subcutaneously (SCIG) and are commonly used in the treatment of immune deficiencies, autoimmune diseases, and certain infectious diseases. By supplying the body with concentrated antibodies, gamma globulin therapy helps fight off infections, modulate the immune response, and reduce the severity of autoimmune conditions. This treatment is crucial for individuals who cannot produce adequate antibodies on their own, such as those with primary immunodeficiency disorders or patients undergoing immunosuppressive therapies.
