The global Gang Drilling Machine market size is predicted to grow from US\$ 6719 million in 2025 to US\$ 10660 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

Gang drilling is performed with a dedicated gang drilling machine. A gang drilling machine is a type of lathe that specializes in gang drilling holes.

While general lathes rotate the material, hole drilling by gang drilling machines is performed by rotating the gang drills. In deep hole drilling, chips generated by the drilling process can block the drilled hole or interfere with the drill's rotation, resulting in damage to the drill. As a countermeasure, cutting oil is continuously injected from the tip of the drill to create a flow of cutting oil inside the drilled hole, which pushes chips backward out of the hole.

The gang drill has a holding section at the base of the drill, called a screwdriver, which is held by the rotating chuck of the gang drilling machine. Cutting fluid is supplied from the rear of the driver, passes through the shank of the gang drill, and is sprayed from the cutting edge at the tip of the drill. For this reason, gang drilling machines are characterized by the center-through coolant function (function to supply cutting oil) in the part that holds the driver.

Depending on the machining depth, the length of a gang drill can be dozens of times longer than its diameter. The depth of drilling causes runout of the shank (shaft) of the gang drill, and several guides are provided on the gang drilling machine to suppress this runout. The number of guides used can be selected according to the hole depth, and the guides move without interfering with machining.

The global market for gang drilling machines is expected to experience steady growth in the coming years. Gang drilling machines are widely used in various industries such as automotive, aerospace, and construction for drilling multiple holes simultaneously in a workpiece. The increasing demand for precision drilling and the need for efficient production processes are driving the growth of the gang drilling machine market.

One of the key factors driving the growth of the gang drilling machine market is the increasing adoption of automation in manufacturing processes. Gang drilling machines offer high precision and efficiency, making them ideal for automated production lines. Additionally, the growing demand for customized and complex components in industries such as automotive and aerospace is fueling the demand for gang drilling machines.

The market for gang drilling machines is also benefiting from technological advancements such as the integration of CNC (Computer Numerical Control) systems and IoT (Internet of Things) technology. These advancements enable operators to program and monitor the drilling process more effectively, leading to improved productivity and quality.

In terms of regional analysis, Asia Pacific is expected to dominate the gang drilling machine market due to the presence of a large manufacturing sector in countries such as China, India, and Japan. North America and Europe are also significant markets for gang drilling machines, driven by the strong presence of automotive and aerospace industries in these regions.
