## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A gap bed lathe machine is a type of lathe that is designed with a removable section in the bed, known as the gap. This gap allows for the turning of larger diameter workpieces that would otherwise not fit between the headstock and tailstock of a conventional lathe with a solid bed. The gap bed lathe typically has a bed that is divided into two sections: the headstock end and the tailstock end. The gap is located between these two sections and can be opened or closed to accommodate different sizes of workpieces. When the gap is closed, the bed provides a solid support for turning operations, similar to a conventional lathe. When the gap is opened, it allows for the passage of larger workpieces that extend beyond the diameter that can be accommodated by the solid bed. Gap bed lathes are commonly used in metalworking, machining, and manufacturing industries for a variety of tasks, including turning, facing, drilling, boring, and threading. They are particularly useful for machining long, large-diameter workpieces that are common in industries such as construction, oil and gas, and heavy machinery manufacturing.

The global Gap Bed Lathe Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
