The global Gas Atomized Titanium Alloy Powder market size is predicted to grow from US\$ 776 million in 2025 to US\$ 1093 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global production of atomized titanium alloy powder reached 96,143 tons, with an average selling price of US\$8,250 per ton. Global annual production capacity for atomized titanium alloy powder was approximately 150,000 tons, with a gross profit margin of approximately 29.2%. Atomized titanium alloy powder is a type of titanium alloy powder produced through atomization technology. Atomization technology involves cooling molten metal with a high-speed gas stream and atomizing it into fine particles. Atomized titanium alloy powder is widely used in aerospace, medical devices, and the automotive industry due to the excellent strength, corrosion resistance, and lightweight properties of titanium alloys. The upstream of atomized titanium alloy powder production includes titanium raw materials, alloying agents, and argon/nitrogen gas. The midstream consists of atomized titanium alloy powder manufacturers, while downstream applications are mainly in the aerospace, automotive, and military industries.

The gas-atomized titanium alloy powder market is characterized by high-end-driven, structural growth: With increasing demand for high-performance, near-net-shape forming in aero-engines, gas turbines, rail transportation, and high-end molds, powder metallurgy and additive manufacturing (such as SLM/EBM) are continuously increasing their demand for titanium alloy powders with controllable particle size distribution, high sphericity, and low oxygen content. At the same time, the high technical barriers of gas atomization processes, the high cost of raw materials and inert gases, and the long capacity expansion cycle mean that supply is more biased towards a few leading

companies with stable quality systems, making prices and delivery schedules relatively sensitive. Future trends mainly focus on: lower oxygen content and narrower particle size distribution, higher formability and batch consistency, and the improvement of customization and certification systems for specific alloys (such as Ti-6Al-4V, Ti-6Al-4V ELI, etc.) to support increased penetration rates.
