## Abstracts

The global Gas Calcined Anthracite Coal market size is predicted to grow from US\$ 168 million in 2025 to US\$ 220 million in 2031; it is expected to grow at a CAGR of 4.7% from 2025 to 2031.

Gas-calcined anthracite (GCA) is made from anthracite coal, known for its low ash, sulphur and volatile substance content. Gas calcined anthracite coal is produced by annealing in a horizontal gas furnace at a temperature of around 1000°C to 1300°C. Gas calcined anthracite coal is made from anthracite coal, known for its low ash, sulphur and volatile substance content.

Gas calcined anthracite coal is primarily used in the production of steel, as a carbon additive in blast furnaces, and in other metallurgical applications. The growth of the steel industry, driven by infrastructure development and urbanization, especially in emerging economies such as China, India, and Southeast Asia, is boosting the demand for gas calcined anthracite coal. Gas calcined anthracite coal are also widely used in the production of aluminum as a substitute for petroleum coke in the production of carbon anodes. As the aluminum industry grows due to increased demand from automotive, construction, and packaging sectors, the need for gas calcined anthracite coal is expected to rise.

The market for gas calcined anthracite coal is influenced by the price fluctuations of raw anthracite coal and the costs of energy required for calcining. The volatility of these input costs can impact profit margins for producers and drive the search for cost-effective production methods.

The demand for high-purity, low-sulfur gas calcined anthracite coal is rising due to

stricter environmental standards, especially in Europe and North America. Producers that can offer high-quality, low-sulfur products will be well-positioned to capture a premium market segment.
