Gas carburizing service is a carburizing process carried out in a gaseous active medium in a carburizing atmosphere and is widely used in the field of metallurgy. The main advantage of this process is the ability to precisely control the carburizing process and improve the quality and performance of the workpiece. The main process parameters involved in gas carburizing include carburizing temperature, holding time, number of furnace gas changes, and carbon potential selection and control. The carburizing temperature is usually between 880°C and 930°C, while the holding time depends on the required carburizing layer thickness and temperature. The number of furnace gas changes and the control of carbon potential are crucial to maintaining the activity of the carburizing process and preventing air from outside the furnace from entering.

The global Gas Carburizing Service market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
