Gas Chromatograph-Mass Spectrometry (GC-MS) is an analytical technique that combines gas chromatography (GC) and mass spectrometry (MS) to identify unknown substances or contaminants.

A GC-MS system is an analytical instrument that combines gas chromatography (GC) and mass spectrometry (MS) technologies. In this system, the sample is first separated through a gas chromatography column, which separates the compounds in the mixture into their individual components. The separated compounds then enter the mass spectrometer in gaseous form, where they are ionized, analyzed, and detected.

GC-MS systems are often combined with productivity-enhancing software that can provide high-resolution analysis of compounds and can identify and quantify various compounds in samples. It is widely used in fields such as chemistry, biology, environmental and food science, and is used for Analyze and identify the composition and structure of compounds.
