In 2025, global Gas Engine Pump output reached about 11 million units and global capacity of around 16 million units. The average unit price is about USD 360, with gross margins near 23%. Gas Engine Pumps are portable or stationary pumping systems powered by gasoline internal combustion engines, designed to move liquids?primarily water?without requiring an external electrical power supply. These pumps convert the mechanical power generated by a gasoline engine into hydraulic energy through an impeller or diaphragm mechanism, enabling the transfer of water or other fluids for irrigation, drainage, flood control, firefighting, construction dewatering, and industrial fluid handling. The supply chain of gas engine pumps typically begins with upstream raw materials and components, including aluminum or cast-iron pump housings, steel shafts, rubber seals, carburetors, fuel tanks, and small gasoline engines produced by engine manufacturers. In the midstream manufacturing stage, pump manufacturers integrate the engine, impeller system, pump casing, and control components into complete pump units through assembly and testing processes. Finally, in the downstream distribution and application stage, finished pumps are distributed through equipment dealers, agricultural supply distributors, construction equipment suppliers, and e-commerce channels, serving end-user sectors such as agriculture irrigation, construction dewatering, emergency flood management, municipal services, mining operations, and disaster response.
